

Characteristics

- minimalist design of small format
- electronic heating
- continuous cooling with body made of glass
- fast boiling
- digital thermometer
- easy cleaning
- fast installation and setting
- power voltage: 110V-230V / 50-60 Hz / 125 W

Instructions

The assembly

- 01 Place the given joint in the red support with grey face upside and screw the glass heater.
- 02 Link a piece of silicone tube from the water network to the lower piping of the cooling gel and another piece from the outflow of the cooling gel to the drainage.
- 03 Place the stopper in the thermometer and place all together in its location (see photo).
- 04 Make sure to close the clamp from the drainage tube to avoid liquid losses.
- 05 Connect the device through the supplied cable to the 230V network and make sure that the switch is off.

Instructions

The technique applied

- 05 Open the water network valve in order to start the cooling process.
- 06 Pour distilled water in the top funnel to the inscribed mark.
- 07 Turn on the thermometer and press the 0/I switch, it will light it up and the sample will start to heat.
- 08 Wait for the boiling to stabilise (for apox. 5-7 min). Jot down the reading results of the thermometer ($T_1 = T_{water}$) and stop the boiling process by pressing again the 0/I switch.
- 09 Open the drainage clamp and pour, at least 3 times, the content of approximately 250 mL glass of water inside the glass water heater to rinse and cool it down.
- 10 Repeat the process in step 06 with the sample to analyze ($T_2 = T_{sample}$) following steps 07, 08 and 09.
- 11 Subtract both annotated temperatures and with the result value read from the table below its corresponding alcoholic %vol. NOTE: TD(Temperature Difference) = $T_1(T_{water}) - T_2(T_{sample})$

Observations

- The control of the water temperature will be done 1-2 a day.
- Be sure to cool down the device after every sample and rinse it with the new sample to be analyzed
- DO NOT PRESS THE 0/I SWITCH WITHOUT LIQUID INSIDE THE HEATER.
- For beers, ciders and other hydroalcoholic solutions that could contain gas and cause foam, make sure to eliminate the gas and introduce a drop of antifoaming silicone for its boiling.

Correlation table between Temp. Difference and %vol. alcohol

TD	% Vol.	TD	% Vol.	TD	% Vol.	TD	% Vol.
